REACT

Project

Netflix clone

The Netflix clone project is a responsive web application built using HTML, CSS, JavaScript, and Bootstrap. It replicates Netflix's homepage with a dynamic movie/series grid and interactive carousels. Bootstrap ensures the layout is mobile-friendly, while JavaScript manages user interactions and content updates. The project demonstrates front-end development skills with a focus on clean design and responsiveness.

PSD To HTML Convert

The PSD to HTML conversion involves transforming a Photoshop design into a fully functional, responsive web page using HTML, CSS, and Bootstrap. The layout is precisely coded to match the design, ensuring responsiveness across all devices. CSS media queries and Bootstrap's grid system are used to maintain a consistent and fluid user experience on both desktop and mobile screens.

Calculator App

To create a calculator app using JavaScript, start by designing the UI with HTML for buttons and display, and style it with CSS. Use JavaScript to handle button clicks, perform arithmetic operations (add, subtract, multiply, divide), and update the display. Basic event listeners will capture user input, while functions will process and return the results dynamically.
